Overall Requirements

- Summary of requirements

Create Patient Scenario
Instructor can create a scenario with demographics, chief complaint, vitals, labs, and medications.

Edit Patient Scenario
Instructor can reopen an existing scenario and change its information.

Scenario Database / Persistence
Scenario data is saved to the database and can be loaded again later.

Save Scenario as Draft
Incomplete scenarios can be saved without being visible to students.

Publish Scenario
Instructor can change a draft into a published scenario that is ready for student use.

Duplicate Scenario
Instructor can copy an existing scenario and use it as a starting template for a new one.

Share Scenario with Students
Published scenarios can be made available to selected students. Your charter explicitly includes sharing published scenarios. PROJECT CHARTER

Validation and Role-Based Access
Required fields are checked, errors are handled, drafts stay hidden from students, and only authorized users can manage scenarios.

1st Feature

Scenario Database / Persistence
Scenario data is saved to the database and can be loaded again later.

ProChart – Feature Requirements

Feature: Scenario Database / Persistence
Project: ProChart – CU EHR Simulation System
Status: Draft – Pending Sponsor Approval

1. Feature Overview

The Scenario Database / Persistence feature will allow ProChart to store patient scenarios in Supabase using JSON data. Patient scenarios will be created as JSON files containing patient information, medical history, assessments, medications, and other clinical data.

The application will retrieve these scenarios from Supabase when needed instead of relying on locally stored JSON files.

This feature will provide the foundation for displaying patient scenarios and supporting future student documentation features.

2. Functional Requirements

FR-1: Store Scenario JSON Data

- The system shall support storing patient scenarios in JSON format in Supabase.
- Each scenario shall have a unique identifier.
- The JSON data shall contain the patient information and clinical data associated with the scenario.

FR-2: Retrieve Scenarios

- The system shall retrieve a stored scenario from Supabase using its unique identifier.
- The retrieved scenario shall contain the same JSON data that was originally saved.

- The application shall be able to use the retrieved JSON data to display scenario information.

FR-3: Update Scenario Data

- The system shall support updating the JSON data of an existing scenario.
- Updating a scenario shall not create a duplicate record.
- The updated JSON data shall be available when the scenario is retrieved again.

FR-4: Data Persistence

- Scenario data shall remain stored in Supabase after the application is closed or restarted.
- Refreshing the application shall not remove saved scenarios.

FR-5: Error Handling

- The system shall handle errors when saving or retrieving scenario data.
- The system shall return an appropriate error if a scenario does not exist.
- Failed database operations shall not be reported as successful.

4. Acceptance Criteria

The feature will be complete when:

1. A patient scenario written in JSON can be stored in Supabase.
2. Each scenario has a unique identifier.
3. A stored scenario can be retrieved using its identifier.
4. The retrieved JSON matches the saved JSON.
5. An existing scenario can be updated successfully.
6. The updated scenario can be retrieved without creating duplicates.
7. Scenario data remains available after refreshing or restarting the application.
8. Missing scenarios and database errors are handled appropriately.
